Brewing Notes:
The suggested mineral additions assume an average NZ water profile and should be fine for most NZ water sources. The target water profile in ppm is Ca - 75, Mg - 10, Na - 10, SO4 - 100, Cl - 50.

Add the dry hops once fermentation slows but while there is still active fermentation to ensure the yeast cleans up any oxygen that is introduced.

1. If flavour minerals are available, add to boil only as mash pH is taken care of with acid malt. The target mash pH is 5.2 - 5.4.
2. If available, add sufficient lactic acid to the sparge water to lower the pH to 5.6 prior to heating (~ 0.5 - 1.5 ml depending on water source).
3. If available, add kettle finings and yeast nutrient 15 min before the end of boil.
4. At flameout, cool the wort to 90C, add the whirlpool hops and maintain for 20 min. When complete, cool to pitching temperature.
5. It is recommended that the yeast be rehydrated per the manufacturer's instructions.
6. Pitch at 18C, maintain for 48 hours then allow to rise to 20C.
7. Once fermentation slows (~7 days), add the dry hops and raise the temperature to 22C for a diacetyl rest. Maintain until fermentation is complete.
8. If possible, cold crash to 2C and let settle for at least 48 hours before packaging.
9. Carbonate to 1.9 - 2.2 volumes of CO2.
